Portland, Oregon,
March 1st 1882.

Mr. Watson,
Dear Sir,

I received your note enclosing my lists of plants, and was much pleased to find that there were two new species, though from my limited botanical library, I had hoped there were more.

Iris tenuis I have seen only on Eagle Creek, a branch of the Clackamas River, which is itself a tributary to the Willamette River, Clackamas County, Oregon. It almost completely usurps the flat, for a miles in

It is somewhat larger and coarser.

Eriogonum glaucum I found on bluffs near the sea at Cape Foulweather Oregon.

The Troximons sent puzzled me much as I found them only in the immature fruited condition of those I sent you Helianthus —? I found in the Warm Springs Indian Reservation, Deschutes River, Oregon, growing on dry hills. It puzzled me greatly without a microscope.

Those last two Veratrums seemed to me to have some marked characteristics which separated them from Californicum, but they may be only varieties.

Lupinus littoralis? I found on the sea-shore at Yaquina Bay, Oregon. Though the leaves are pubescent on both sides, in all other characteristics it seems to agree. This point threw

length, and as it was but just coming into bloom when I visited the spot, I was only able to collect a few specimens. I shall revisit the spot a little later in the Spring, and shall be pleased to send you some roots, and extra specimens. The petals and sepals are mostly white, as you found the specimen, lightly striped and blotched with light yellow and purple. I'll send you more exact description later.

Do I understand that Rubus lasiococcus is a new species as regards my discovering it, or as regards publication. I cannot tell, in seeing Mr. Gray's name after it, whether he has previously named it or not. This was found near Mt Hood, at high altitudes in the Cascades, along with Pedatus.

I have two Sericeus mixed, so I cannot tell which I sent you. One with smooth, entire margined leaves, which I took to be Douglasii, was sent me from near Colfax, Eastern Washington Territory. Another, which I considered to be lugens, I obtained in the Willamette valley, near Eugene. I cannot tell which I sent you. Later Douglasii? I obtained in low ground at Hood River, just the other side of the Cascades, on the Columbia River. It grows near moist rills, in rather marshy places, about one mile back from the river. I found what I supposed to be the same, and which I think I sent you near the head waters of the Deschutes River

me off the scent in the analysis.
~~Sedimus ordinal~~?
Will you please inform me what auxiliary works I can find to assist me in the study of the North West flora? I, of course, have Gray's Eastern Botany, both your works on the "Botany of California", and I intend sending for "Torrey and Gray" with this mail. Will you please tell me where I can obtain your work on "North American Liliaceae". If you have any copies at your disposal, and would send me one, with the price, I would be much obliged to you. I believe the new Torrey and Gray is now called "Grays Synoptical Flora"; am I not right?

Respect yours,

471 7th St. Portland. L. F. Henderson.
